PACKAGING APPL CAT ON OVER WRAPPER PACKAGING MACHINE APPLICATION SHEET

On an over wrapping machine, the film is charged as it un-winds from the reel. This charge will attract airborne contamination onto the material which results in rejects and loss of revenue. The static charge can also jam the machine as the charge becomes so high that it attracts to the machine rollers which act as an earth potential.

By fitting PULSElectronic ionising bars to the un-wind, you will remove the static charge and prevent dirt and other airborne contamination from attracting to the web. This will increase productivity and profits whilst reducing waste and down time.
