

Applications

PACKAGING APPL CAT ON POLYTHENE BAG HANDLE CHARGING APPLICATION

When reinforcing the handles on plastic bags, a further sleeve is added for strength. This sleeve can repel from its set position due to static charges on either the bag or the sleeve itself. This causes misalignment, wastage, down time and rejects.

After the sleeve has been positioned, you can induce a charge into the material using a PULSElectronic charging system. This will hold the sleeve while the thermo weld is completed and prevent wastage thus increasing productivity.
